

**Amendments to the Claims:**

This listing of claims will replace all prior versions and listing of claims in the application:

5    **Listing of Claims:**

Claim 1-10 (cancelled).

Claim 11 (previously presented): An active matrix display device comprising:

- 10       a plurality of scanning lines;
- a plurality of data lines;
- a plurality of pixels, each of the pixels electrically connected to one  
         corresponding scanning line and one corresponding data line, each  
         of the pixels comprising:
  - 15           a single first active device having a first end electrically  
                 connected to the corresponding scanning line, a second  
                 end electrically connected to the corresponding data line,  
                 and a third end;
  - 20           a plurality of active-type light emitting devices electrically  
                 connected in parallel with each other, each of the  
                 active-type light emitting devices being connected  
                 between a source of first potential and a source of second  
                 potential, each of the active-type light emitting devices  
                 comprising:
    - 25               a light emitting device electrically connected to the  
                         source of second potential; and
    - a second active device having a fourth end  
                         electrically connected to the third end, a fifth  
                         end electrically connected to the source of first  
                         potential, and a sixth end electrically connected

to the light emitting device, wherein the single  
first active device switches each of the  
active-type light emitting devices; and  
a storage capacitor having a first electrode electrically connected to the third  
5 end of the single first active device and the fourth end of the  
active-type light emitting devices, and a second electrode  
electrically connected to the source of first potential end.

Claim 12 (previously presented): The active matrix display device of claim 11,  
10 wherein the single first active device is a first thin film transistor, and the  
first end is a gate electrode of the first thin film transistor, the second end is  
a drain electrode of the first thin film transistor, and the third end is a source  
electrode of the first thin film transistor.

15 Claim 13 (previously presented): The active matrix display device of claim 11,  
wherein the storage capacitor is electrically connected between the third end  
of the single first active device and the source of first potential that is  
utilized for supplying a constant potential.

20 Claim 14 (previously presented): The active matrix display device of claim 13,  
wherein the source of first potential is utilized for supplying a constant  
potential.

Claim 15 (original): The active matrix display device of claim 11, wherein each of the  
25 second active devices comprises a second thin film transistor or a  
complementary metal-oxide semiconductor (CMOS).

Claim 16 (original): The active matrix display device of claim 15, wherein the fourth  
end is a gate electrode of the second thin film transistor, the fifth end is a  
30 source electrode of the second thin film transistor, and the sixth end is a

drain electrode of the second thin film transistor.

5           Claim 17 (original): The active matrix display device of claim 11, wherein each of the  
light emitting devices comprises an organic light emitting diode (OLED) or  
a light emitting diode (LED).

10           Claim 18 (previously presented): The active matrix display device of claim 11,  
wherein when an electrical shortage occurs in one of the active-type light  
emitting devices of a pixel, the pixel displays an image via the other  
active-type light emitting devices of the pixel.
